Here is our first release of the Multimenu Module for our [Multicategories Component for Joomla!1.5](#). This is modification of the standard Joomla!1.5 Mainmenu module that uses Multicategories categories as menu items. The version 1.0.0 has the basic functionality that includes:

- Multicategories Component for Joomla!1.5 categories support;
- Multicategories Component for Joomla!1.5 articles support;
- standard menu items support (Multimenu Module Extended Edition only).

If you have any questions about our Multimenu Module you can post them on our [Other Products Support Forum](#).

Multimenu Module is free to use and released under GNU/GPL. To download the component please go to [Multimenu Module](#) project page.
